

Forestry Notes

Firewood: Which Species Produces the Most Heat?

Species listed by the amount of heat generated per species by burning a cord of dry wood (about 20% moisture content) as measured in millions of British Thermal Units (BTUs)

Species	BTUs	Species	BTUs	Species	BTUs
<u>Osage-orange</u>	32.9	<u>Walnut, black</u>	22.2	<u>Pine, shortleaf</u>	19.0
<u>Oak, white</u>	29.1	<u>Coffeetree, Kentucky</u>	21.6	<u>Maple, red (swamp)</u>	18.7
<u>Dogwood</u>	28.6	<u>Elm, red (slippery)</u>	21.6	<u>Boxelder</u>	18.3
<u>Hop hornbeam (ironwood)</u>	27.9	<u>Hackberry</u>	21.2	<u>Redcedar, eastern</u>	18.2
<u>Locust, Black</u>	27.9	<u>Persimmon</u>	21.0	<u>Alder</u>	17.6
<u>Hickory, shagbark</u>	27.5	<u>Elm, Siberian & Chinese</u>	20.9	<u>Willow</u>	17.6
<u>Apple</u>	27.0	<u>Birch, paper</u>	20.8	<u>Pine, pitch</u>	17.1
<u>Ash, white</u>	26.6	<u>Tamarack (larch)</u>	20.8	<u>Pine, red</u>	17.1
<u>Hickory, bitternut</u>	26.7	<u>Douglas-fir</u>	20.7	<u>Gum, black (tupelo)</u>	17.0
<u>Locust, honey</u>	26.7	<u>Sweetgum</u>	20.6	<u>Buckeye, Ohio</u>	16.4
<u>Mulberry</u>	25.8	<u>Catalpa</u>	20.4	<u>Hemlock</u>	15.9
<u>Maple, sugar*</u>	25.0	<u>Cherry, black</u>	20.4	<u>Cottonwood</u>	15.8
<u>Oaks, red</u>	24.6	<u>Ash, green</u>	20.0	<u>Pine, eastern white</u>	15.6
<u>Beech, American</u>	24.0	<u>Elm, American</u>	20.0	<u>Spruce</u>	15.5
<u>Birch, black (sweet)</u>	24.0	<u>Sycamore</u>	19.5	<u>Yellow-poplar (tulip tree)</u>	15.0
<u>Birch, Yellow</u>	23.6	<u>Maple, silver</u>	19.0	<u>Basswood (linden)</u>	13.8

*One dry cord of sugar maple will produce about the same amount of heat as one ton of anthracite coal (25.0 BTUs)

Although some species of trees are preferred for firewood over others, wood from practically all species can be burned to heat homes and buildings (except for wood that has been pressure treated, painted or stained, as these can release toxic materials when burned).

Proper seasoning (drying) is the key to heating efficiently with firewood. Ideally the moisture content of firewood should be at 20% or below for the greatest heat value.

Live standing trees contain as much as 60% or more of their weight as water. This high percent of water makes the wood hard to ignite and burn. Proper drying of green (wet) wood to about 20% moisture content makes the wood easier to light and burn efficiently.

Properly air-drying wood requires cutting, splitting, and stacking it outside, off the ground, protected from rain by a top cover for six to nine months.
